EDUCATION

University of Chicago September 2026 – Expected December 2027
M.S. in Applied Data Science | The Data Science Institute Scholarship

University of Pennsylvania August 2018 – May 2022
B.S.E. in Computer Graphics | Minors in Mathematics and Fine Arts | Magna Cum Laude

WORK EXPERIENCE

InterSystems July 2022 – February 2025
Quality Development Engineer *Cambridge, MA*

- Validated the MVP release of Bulk FHIR data export from end to end, including asynchronous data transfer, OAuth2 authorization workflows, and REST API endpoints to ensure secure exchange of large clinical data
- Built automated testing pipelines with Python scripts, relational databases, and analytical email reports to increase sprint cycle efficiency by 20%
- Conducted HL7 FHIR conformance testing using Inferno and Touchstone tools to support the platform's ONC (g)(10) certification for standardized patient data access
- Queried archived test results and build data to narrow down causes of test failures, saving development teams 5 hours of debugging each week
- Developed upgrade tests for systems migrating from legacy storage to new data models to ensure data integrity
- Maintained 10+ Confluence pages on internal testing frameworks, improving cross-team communication and reducing new-hire onboarding time

SELECT PROJECTS

Apparel Price Modeling and Fabric Composition Analysis February 2026 – April 2026

- Built a data pipeline integrating fabric composition data from public API endpoints across 26 clothing brands and compiling the results into a structured CSV of 700+ products
- Normalized 196 free-text fabric labels into 24 canonical fiber features using a regex allowlist, then applied K-means and PCA to segment 416 products into four material families
- Trained a Random Forest regressor on 416 products to predict price, reducing MAE by 12.5% versus a category-median baseline

Dao TFT: Real-Time Strategy Recommendation Engine June 2026 – July 2026

- Built a Next.js/TypeScript decision engine for the game Teamfight Tactics (TFT) to help players by ranking team compositions from the player's live game state
- Engineered an automated ETL pipeline via GitHub Actions to pull data daily from external sources, validate it against Zod schemas, and auto-deploy to Vercel

Procedural Tibetan Monastery Generator January 2022 – May 2022

- Designed and built a procedural generation tool in Houdini that produces Tibetan monastery-inspired architecture from L-system grammars, replacing manual 3D modeling with a parameterized pipeline for game and film scene production
- Wrote VEX scripts using point-cloud neighbor queries and conditional filtering to classify geometry into wall, window, and door groups, with Perlin noise thresholding and randomized clustering to control placement density and variation

TECHNICAL SKILLS

Programming Languages	Python, C++, SQL, TypeScript, JavaScript, Java, GLSL
ML & Data Science	scikit-learn, pandas, NumPy, PyTorch, matplotlib
Tools & Platforms	AWS, Docker, Claude Code, Git, CI/CD, Linux, REST APIs
